

Elijah-Christian Wiegand

SOFTWARE ENGINEER

+1 6317042281 | ewiegand51@gmail.com | [Elijah-Christian Wiegand](#) | [ECdub27](#) | [Portfolio](#)

Summary

Full Stack Developer with senior-level experience delivering enterprise solutions across .NET, Java, and modern TypeScript stacks. Recently reverse-engineered undocumented Guidewire InsuranceNow billing systems and produced critical documentation, while delivering four same-day production hotfixes on high-volume financial workflows. Proven track record bridging frontend and backend, optimizing performance, and translating business requirements into scalable services. Eager to apply deep debugging and integration expertise to accelerate reliable product delivery for a forward-thinking organization.

Experience

Planet Euphoria

January 2026 - Present

Software Developer/Technical Partner

Commack, NY, USA

- Engineered a server-side pricing checkout backend (FastAPI, Python 3.14) on Shopify Admin GraphQL that mints/caches OAuth2 client-credentials tokens and computes prices server-side, never trusting the client; added HMAC-SHA256 App Proxy signature verification with timestamp replay protection, which strengthened checkout security and prevented client-side price tampering
- Closed a devtools re-rip exploit by moving the weighted random pick to the server: admin-API pool query, 5-min cache, and server-side selection on checkout and credit redeem (replaced the client-side pick entirely).
- Replaced in-process idempotency dicts with Redis-backed idempotency to make financial endpoints crash-safe under retries and redeloys.
- Built the interactive 3D mystery-pack experience as React + TypeScript with Three.js (@react-three/fiber) integrated into the production Shopify theme with strict namespacing to avoid CSS/JS collisions.
- Wrote the production runbook (xclusive_theme/RUNBOOK.md): architecture map, health checks (UptimeRobot / Sentry / Prometheus), and failure-mode fix lists for 502s, credit drift, and theme-sync breaks.
- Delivered a 1,337-line Python test suite across 10 files using pytest and Postman, covering HMAC authentication, weighted-pick fairness, idempotency, and webhook validation, which increased code coverage and caught critical bugs before release
- Shipped new feature Shirtstakes across five repositories and three platforms-FastAPI backend, Liquid theme, Shopify Customer Account extension, React Native app, and Vite bundle-using Gradle CI pipelines, enabling a seamless rollout that expanded user engagement on all channels

Preferred Risk Insurance

June 2024 - January 2026

Software Engineer

Chicago, IL

Guidewire InsuranceNow (policy admin / rating / billing, EJB + config rules): Reverse-engineered undocumented billing systems (payment calc, AR cycles, SOAP), the first engineer to produce internal docs; became the team reference for them.

- Root-caused a payment-calculation bug that senior developers had missed by applying actuarial math to demonstrate that the WrittenPremium short-rate formula broke policy reinstatements after repeated cancel/reinstate cycles; convinced stakeholders to fund a permanent fix, shipped the solution same day at no cost
- Shipped regulatory launches across nine states (TN, OH, WI, AZ, OK, TX, MO, IN, WV), implementing pay-plan and statutory-reserve changes, cancellation-fee logic, ISO liability symbols, LSP declaration forms, attachment types, and driver/vehicle surcharge rules
- Diagnosed endorsement-flow failures and unapply/reapply bugs senior devs couldn't resolve; designed custom handlers fixing both in production.
- Responded to 4 same-day production incidents on live financial paths (invoice gen, cancellation fees, premium finance) with zero downtime during regulatory launches.
- Designed PRISConfig, a metadata-driven config layer (Java class + XML) that removed code deployments for billing-rule changes and cut new-state onboarding ~40%.
- Fixed data integrity at scale: OHM duplicate policy numbers, VINMASTER/Redbook model-name mismatches, bulk policy data fixes from SQL.
- Delivered 67 tickets (75 story points) in the first 4 months on an insurance quoting UI; peak 28 points in one sprint.
- Cut quoting-page load ~50% via batch processing and async rendering.
- Built marketing/portal pages across 5+ sister brands (FCIC, USIC, TXR) using CMS components, not hard-coded per-site pages (IOL component library).
- Automated recurring ops with Python; kept internal app data accuracy at 98%.

CodeWizardsHQ

October 2023 - October 2024

Software Developer/Coding Instructor

- Taught Python, JavaScript, and HTML/CSS to middle and high school students - designed custom labs that achieved an 84% average class pass rate.

24 Hour Medical Staffing Services, LLC

May 2022 - May 2024

Front End Developer / System Admin

Remote

- Supported the company's React and JavaScript web presence by implementing UI updates, fixing bugs, and maintaining site assets with Git and npm, which enhanced page load speed and reduced user-reported issues
- Administered LaborEdge and Nexus recruitment platforms, troubleshooting frontend-backend synchronization problems with REST APIs and Postman, which decreased sync errors by 30% and ensured accurate platform records
- Wrote Python automation scripts that streamlined routine admin tasks and integrated with MongoDB and MySQL via DBeaver, cutting manual overhead by approximately 20% and supporting database operations for the team
- Served as primary system administrator for LaborEdge/Nexus recruitment platforms, resolving frontend/backend sync issues and improving data accuracy to 98%.

EDUCATION

SUNY Buffalo State

Bachelors, Psychology

December 2017 - December 2019

Professional Certificates (Codecademy by Skillsoft)

Certificate Of Completion, Computer Science

Commack, NY, USA

- **Coursework:** .NET, Full-Stack development, Java, Typescript,, Front-end Engineer

PROJECTS

Connected Services Platform

- Full-stack microservices platform built with Next.js, Java, and PostgreSQL - integrates a banking/financial planning assistant, a music key detection tool, and a media player under a single unified frontend.
- Architected a service-oriented backend with RESTful APIs connecting independent microservices, managing state and API orchestration across distributed services.

Mac Cleaner

- Personal Mac Cleaner to rival CleanMyMac

Skills

- **Languages:** Java, C#, JavaScript/TypeScript, Python, SQL
- **Frontend:** React, Angular, HTML/CSS, Razor Pages, Responsive Design
- **Backend:** NET Core, Spring Boot, REST APIs, SOAP, Async Processing
- **Databases:** SQL Server, PostgreSQL, NoSQL (MongoDB), JDBC
- **Tools:** Git, Jira, Postman, Swagger, DBeaver, Azure, Gradle, Docker
- **Practices:** OOP, CI/CD, Root Cause Analysis, Legacy Refactoring, Agile/Scrum
